PRESORTED FIRST CLASS MAIL U.S. POSTAGE PAID MARYSVILLE, CA PERMIT NO. 128

Linda County Water District 2018 Water Quality Consumer Confidence Report Public Water System Number 58-10002

Dear Customer:

Linda County Water District is required by the U.S. Environmental Protection Agency (U.S. EPA) and the State Water Resources Control Board (State Board), Division of Drinking Water to provide you with an annual report on the quality of the water served to our customers. If you have any questions about the quality of the drinking water in Linda or would like additional information, please call me at 743-2043, or stop by my office at 1280 Scales Avenue between 8:00 a.m. and 5:00 p.m. Monday through Friday. If you are a landowner of rental property, please provide copies to your tenants. The Board of Directors of the Linda County Water District meet the 2nd Monday at 7:00 P.M. each month here at the District office. The public is encouraged to attend.

Brian Davis, District Manager

The water supply for Linda originates from ground water pumped from 6 wells, Nos. 3, 4, 12, 14, 15 and 16. These wells are strategically located throughout the District to ensure a constant pressure level. The treatment process consists of aeration, filtration and chlorination.

The State allows us to monitor for some contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of our data, though representative, are more than one year old.

DEFINITIONS OF SOME OF THE TERMS USED IN THIS REPORT:

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. Primary MCLs are set as close to the PHGs (or MCLGs) as is economically and technologically feasible. Secondary MCLs are set to protect the odor, taste, and appearance of drinking water.

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs are set by the U.S. EPA.

Public Health Goal (PHG): The level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.

Primary Drinking Water Standard (PDWS): MCLs, MRDLs and treatment techniques (TTs) for contaminants that affect health, along with their monitoring and reporting requirements.

Maximum Residual Disinfectant Level (MRDL): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG): The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

ppb: parts per billion or micrograms per liter, **ppm:** parts per million or milligrams per liter. **nd:** non-detectable at testing limit

GENERAL INFORMATION ON DRINKING WATER:

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the U.S. EPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immunocompromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. U.S. EPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, that can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, that may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, that are byproducts of industrial
 processes and petroleum production, and can also come from gas stations, urban stormwater runoff, agricultural
 application, and septic systems.
- Radioactive contaminants, that can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, the U.S. EPA and the State Board prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. State Board regulations also establish limits for contaminants in bottled water that provide the same protection for public health.

MICROBIOLOGICAL WATER QUALITY:

In our distribution system, we test the water weekly for coliform bacteria. No coliform bacteria were detected during 2018.

LEAD & COPPER TESTING RESULTS:

Constituent	Units	Sample	No. of Sites	90th Percentile	Action	PHG	No. of Sites that Exceeded
		Date	Sampled	Result	Level		Action Level
Lead	ppb	2017	30	nd	15	0.2	0
Copper	ppm	2017	30	0.063	1.3	0.3	0

No schools requested lead testing during this reporting year. If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The Linda County Water District is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/lead.

DETECTED CONTAMINANTS IN OUR WATER:

The following tables summarize all detected chemicals in our water during the most recent sampling.

Detected Constituents with Primary Drinking Water Standard

Constituent	Units	Average	Range	Sample	MCL	PHG	Origin
		of Source	-	Date			
Arsenic	ppb	1.16	nd - 3.73	2017	10	0.00	naturally occurring; run-off from orchards, glass,
						4	and electronics production waste
Barium	ppm	0.12	0.06 - 0.17	2017	1	2	oil drilling waste and natural deposits
cis-1,2-	ppb	1.1	nd - 5.7	2017	6	100	discharge from industrial chemical factories;
Dichloroethylene							major biodegradation byproduct of TCE and PCE
							groundwater contamination

Detected Constituents with Secondary Drinking Water Standard

Constituent	Units	Average of Source	Range	Sample Date	Secondary MCL	PHG	Origin
Chloride	ppm	40.3	15.0 - 78.1	2017	500	n/a	naturally occurring
Color	units	3.5	nd - 5	2017	15	n/a	naturally occurring
Sulfate	ppm	12.1	1.03 - 44.1	2017	500	n/a	naturally occurring
Total Dissolved Solids	ppm	227	156 - 274	2017	1000	n/a	naturally occurring

Additional Detected Constituents without Drinking Water Standard

Constituent	Units	Average of Source	Range	Sample Date	Origin
Sodium	ppm	24.0	18.2 - 34.0	2017	naturally occurring
Total Hardness	ppm	161	86 - 238	2017	naturally occurring

Disinfection Byproducts, Disinfectant Residuals, and Disinfection Byproducts Precursors

Constituent	Units	Average	Range	Sample	MCL	PHG	Origin
				Date	[MRDL]	[MRDLG]	
Chlorine	ppm	1.06	0.08 - 2.04	2015	[4.0 as Cl ₂]	[4 as Cl ₂]	drinking water disinfectant added for
							treatment
Total Trihalomethanes	ppb	17	n/a	2017	80	n/a	byproduct of drinking water disinfection
Haloacetic Acids	ppb	nd	n/a	2017	60	n/a	byproduct of drinking water disinfection

ADDITIONAL INFORMATION:

Attention: Reese Crenshaw, (530) 224-4861

A source water assessment has been completed for the six wells serving the community of Linda. The sources are considered most vulnerable to the following activities: Well 12 has contaminants associated with these activities. Water from Well 12 is treated before it enters the distribution system.

Automobile Repair (Wells 3 and Automobile Gas Stations (Wells 2	,	Sewer Collection Systems (<i>Wells 3, 4, 15 and 16</i>) Septic Systems (<i>Well 15</i>)
